

Java 2 SDK Standard Edition Installation Instructions

1. Download the Java 2 SDK 1.4.1.02.exe file from <http://java.sun.com/j2se/1.4.1/download.html>.
2. Double-Click on j2sdk-1_4_1_02-win.exe. Follow the instructions to install the SDK.
3. Set the PATH:
 - a. From the Control Panel, select System, select Environment, and look for "PATH" in the User Variables and System Variables.
 - b. Add the path of the SDK to the "Path" variable and click "Set", "OK" or "Apply". A typical value for PATH is:

C:\jdk1.4.1_02\bin

Note:

- Capitalization doesn't matter.
- The PATH can be a series of directories separated by semi-colons (;).
- If you're not sure where to add the path, add it to the right end of the "Path" in the User Variables.
- Microsoft Windows looks for programs in the PATH directories in order, from left to right. You should only have one **bin** directory for a Java SDK in the path at a time (those following the first are ignored), so if one is already present, you can update it to jdk1.4.1_02.
- The new path takes effect in each new Command Prompt window you open after setting the PATH variable.

Future References:

- **To compile java source files:**
Use the Java byte code compiler, javac.exe, to compile applications and Applets that you write. For example, to run the compiler on a file called **MyApp.java**, go to the prompt windows and execute this command:

C:\> javac MyApp.java

- To execute the .class file:
To run your application (.class file), go to the prompt window and execute this:

C:\> java MyApp
